

LAMPPOST

A yard sale that takes Lightning and has no server

A static page, hosted on Nostr, that takes real Lightning payments by sending CLINK requests over public relays to the seller's own node. No backend, no database, no accounts, no pooled liquidity, and no custody of anyone's keys.

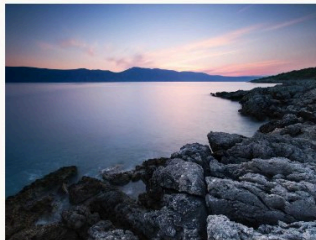

Storefront	https://npub1lvvw3qfk9fmjuxll9lpxpf0lg19sr5l60gj5xjv5scphwnxmg7sq0lalws.nsite.lol/
Builder	https://npub1qqm97k4eg432zydvkc1nhhnkyd7dgjxmndmaapk48jzms9uyl5qqlerxa2.nsite.lol/
Proven with real money	6,000 sats settled, and the page read the settlement receipt nobody else can decrypt
Payments	CLINK Offers (kind 21001) — buyer to the seller's node, over relays
Refunds	CLINK Debit (kind 21002) — capped and kill-switched by the node itself
Authoring	CLINK Manage (kind 21003) — no node credentials in the browser
Hosting	NIP-5A nsite, four complete Blossom mirrors
Cold load	32.01 KB gzip JS, + 3.9 KB only if you tap Buy

Moving Sale — Colonia Americana

Saturday 23 August, 8am–2pm. Cash, or Lightning. Everything must go.

Oak dining table + 4 chairs SOLD

SOLD — leaving it up so you can see what a sold item looks like.

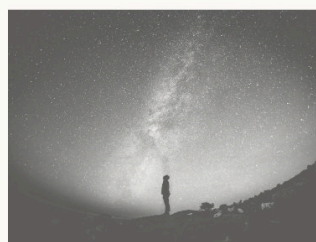

175,000 sats

Full-length mirror SOLD

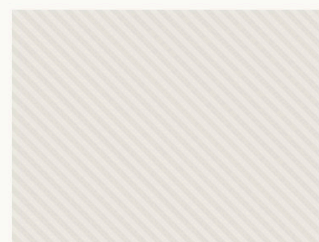

Gone. Sold the old way, with a status tag instead of a stock count.

22,000 sats

Houseplants, various SOLD

6,000 sats

Moving boxes, free

Free. Take them, please. They are in the garage.

Free 12 available

A static page with no backend behind it. It is served from Blossom blobs addressed by a Nostr pubkey, and every item on it was read live from four public relays at page load. Sold items keep their stamp rather than disappearing, so a buyer arriving from a printed flyer can see what went. Live at <https://npub1lvvw3qfk9fmjuxll9lpxpf0lg19sr5l60gj5xjv5scphwnxmg7sq0lalws.nsite.lol/>

Where should a refund go?

A Lightning address or noffer. If two people buy the last one, this is where your money comes back — the seller's node will not take a payment it could not refund. An noffer is refunded over the same relays as this page; a Lightning address has to be looked up on its provider's server, so use an noffer if you have one.

This is the only way to pay this item. A wallet that scans the seller's offer code directly is turned away by their node for the same reason — it has nowhere to send a refund. Nothing here reaches a server of ours; there isn't one.

Buy — 30,000 sats

The detail view asks for one thing before it will request an invoice: a refund pointer. That is not ceremony. Stock is a number on a relay, relays reorder and replay, and if two people buy the last lamp the second one has to be given their money back — so the page refuses to take money it could not return. The location is a `geo:` link, handed to the OS, so no tile server is contacted and nobody is told a buyer looked.

03 The whole thesis, in one screenshot

Expires in 15 minutes. Keep this page open — it confirms
here when the payment lands, because the receipt is
encrypted to this page and to nobody else.

This QR is a real BOLT11 invoice. A static page with no server asked the seller's own Lightning node for it by sending a CLINK Offers request (kind 21001) over public Nostr relays, and the node answered the same way. No backend of ours took part, no liquidity was pooled, and no key was custodied. The page then checks the invoice amount against the listed price and refuses it if they disagree — a guard an LNURL QR cannot offer. The QR encoder is a 3.9 KB chunk fetched only on tapping Buy, never on cold load.

Houseplants, various **SOLD**

6,000 sats

Colonia Americana, Guadalajara

These plants were bought for 6,000 real sats. A watcher on the seller's machine observed the settlement on the node and republished the listing as sold — and it does that holding no signing key of the seller's. If the same item oversells, the same watcher refunds the loser automatically over a CLINK Debit (kind 21002), from a key with no funds and no identity, capped by the node itself rather than by our code.

Colonia Americana, Guadalajara

Priced in MXN — cash at the table. This page pays over
Lightning, in sats, and it has no way to convert.

Priced in pesos, cash at the table, and deliberately no Buy button. The interesting part is that it says so. An item with no payment path used to render a price and no way to act on it, which reads as a bug; every non-buyable state now names its own reason — fiat, free, below the node's 10-sat invoice floor, or priced above inbound liquidity.

From 52 and

Scanning a printed sticker for an item that has since been taken down used to fall through to the index in silence, which looks broken to the one visitor who arrived from the physical world. It now says what happened. This is the failure mode that only exists because the stickers are real.

07

No second template and no export step — one `@media print` block turns the sale into the flyer that gets taped to a lamppost, QR included. The storefront QR is a build-time SVG symbol, so printing costs no encoder in the bundle.

08 The seller's authoring app, which is also a static page

Lamppost

Author a yard-sale item. It is signed by your own signer, its photo goes to Blossom, its offer is minted on your own node over CLINK, and the listing goes to public relays. Nothing here has a server of ours behind it.

1 - YOUR SIGNER

Nothing in this app ever sees your key. It asks your signer to sign, and your signer decides.

Browser extension (NIP-07)

Connect a bunker — one approval

...or paste a bunker's URL or a NIP-06

bunker.g... or you@example.com

Connect

2 - YOUR NODE optional

CLINK Manage pointer

manage1...

No node — items will publish as cash-only, with no Buy button.
Run node: `nsite/note/lammanage` is once, on the machine with your node, and paste the line it writes.
This pointer addresses your account, so it stays in this browser — it is never published and never sent anywhere but your own node.

3 - YOUR SALE

This is the manifest at the top of your storefront, and it is one signed event that every item points at. Publish it once, then again whenever the details change or you want a new item listed in order.

Sale name

Yard sale

Date and hours

Saturday, 8am-2pm. Cash, or Lightning.

No node event has a field for a sale's date or its opening hours — not NIP-06, not the collection spec. This line is where they live, and it prints on the flyer under the manifest.

Neighbourhood

Columbia Americana, Guadalajara

Geotag optional, makes the neighbourhood specific

Sevens23

Use my location

Your storefront turns this into a geo-link, which your buyer's phone hands to whatever map app it already has — no map is loaded from anybody's server, and nothing of ours learns that they looked. "Use my location" reads the browser's own geolocation and rounds it to about 70 metres. Leave it empty and the neighbourhood is just text.

1 signature: 1 sets 0 items in the order shown below, and X is a replacement — node has no edit — so publishing it again replaces what is there now.

Publish my sale

4 - THE ITEM

Title

Brass floor lamp

Slug is permanent address, filled in from the title

brass-floor-lamp

One line

Revised, works, some patina on the base.

Price, in sats

1000

How many

1

Sats only. There is no currency conversion anywhere in this app — that would need a price oracle, and an oracle is somebody else's server. Price something in pesos by leaving the node field empty; it lists, it just has no Buy button.

Photo

Choose File

No file chosen

Resized in your browser to 1000, 480 and 160px. The original is never uploaded.

Photo description for screen readers

A brass floor lamp with a linen shade.

2 signatures: 1 listing + 1 availability sig. Your signer should ask once per kind and remember the rest — if it asks every time, it ignored the permissions we requested.

Publish this item

5 - YOUR SALE SO FAR

Read straight off the public relays with no credential at all — the same events any visitor sees, which is why this list can exist in a page that nodes no key.

Load my items

What is not here is what each sale sees worth. CLINK Manage's only resource is the offer — there is no invoice or settlement resource anywhere in CLINK — and the node's own call for it, `GetInvoiceForDecision`, takes a request kind a signer holding your key on your phone cannot construct. So a browser that never touches your key cannot read your sales, and that is the cost of the custody claim rather than a missing feature. Run node: `nsite/note/report-ts` on the machine with your node for amounts, timestamps and related pointers.

7 - PUBLISH THE SALE AS A WEBSITE

Your storefront is a handful of static files. They go to Blossom servers as blobs, and a signed manifest on the relays says which blob is which path. That manifest is the whole site: no host, no DNS, no certificate, no account. It is served at your own relay, which is how the page knows whose sale to read.

Gateway

note.kid

Any NIP-5A host will serve it — the gateway is only where you point people. Changing it changes the URL, printed on the flyer's tear-off tabs, so set it before you deploy.

7 signatures: 5 file uploads + 1 site manifest + 1 Blossom server list. The uploads are all one kind, so your signer should ask about them once.

Deploy my storefront

Gateways cache for an hour and serve the previous version until it lapses, while the relays and Blossom update in seconds. Do not redeploy on the day of the sale.

The seller writes their sale here and it holds no key: signing goes through a browser extension (NIP-07) or a remote bunker (NIP-46), and the seller's node is reached with a narrow CLINK Manage grant (kind 21003) rather than node credentials. Each item is published as a listing and gets its offer minted on the seller's own node. The builder itself deploys as an nsite — if our own app needed a server, the pitch would be false. Live at <https://npub1qqm97k4eg432zydvkclnhhnkyd7dgjxmndmaapk48jzms9uyl5qqqlerxa2.nsite.lol/>

09 The sale is authored, not inherited

nmanage1...

No node — items will publish as cash-only, with no Buy button.
Run node spike/authorize-manage.ts once, on the machine with your node, and paste the line it writes.
This pointer addresses your account, so it stays in this browser — it is never published and never sent anywhere but your own node.

3 · YOUR SALE

This is the masthead at the top of your storefront, and it is one signed event that every item points at.
Publish it once, then again whenever the details change or you want a new item listed in order.

Sale name

Yard sale

Date and hours

Saturday, 8am–2pm. Cash, or Lightning.

No nostr event has a field for a sale's date or its opening hours — not NIP-99, not the collection spec. This line is where they live, and it prints on the flyer under the masthead.

Neighbourhood

Colonia Americana, Guadalajara

Geohash optional; makes the neighbourhood tappable

9ewmxg9

Use my location

Your storefront turns this into a geo: link, which your buyer's phone hands to whatever map app it already has — no map is loaded from anybody's server, and nothing of ours learns that they looked. "Use my location" reads the browser's own geolocation and rounds it to about 76 metres. Leave it empty and the neighbourhood is just text.

1 signature. It lists 0 items in the order shown below, and it is a replacement — nostr has no edit — so publishing it again replaces what is there now.

Publish my sale

Until this slice the builder imported the demo fixture's sale and stamped it on every item anyone authored — our `d` prefix, our neighbourhood, our geohash — into a collection nothing in the builder ever published. A seller in Oaxaca published Guadalajara items, signed by their own key, permanently, to four public relays. The builder now writes its own kind 30405. Decoding a geohash for the map link also found the fixture's own had been 5.94 km wrong for eight slices, because nothing had ever decoded one.

10 Editing, restocking, and the one thing this architecture genuinely cannot do

Photo description for screen readers

A brass floor lamp with a linen shade.

2 signatures: 1 listing + 1 availability step. Your signer should ask once per kind and remember the rest — if it asks every time, it ignored the permissions we requested.

Publish this item

5 · YOUR SALE SO FAR

Read straight off the public relays with no credential at all — the same events any visitor sees, which is why this list can exist in a page that holds no key.

Load my items

What is not here is what each sale was *worth*. CLINK Manage's only resource is the offer — there is no invoice or settlement resource anywhere in CLINK — and the node's own call for it, `getUserOfferInvoices`, rides a request kind a signer holding your key on your phone cannot construct. So a browser that never touches your key cannot read your sales, and that is the cost of the custody claim rather than a missing feature. Run `node spike/sales-report.ts` on the machine with your node for amounts, timestamps and refund pointers.

7 · PUBLISH THE SALE AS A WEBSITE

Your storefront is a handful of static files. They go to Blossom servers as blobs, and a signed manifest on the relays says which blob is which path. That manifest is the whole site: no host, no DNS, no certificate, no account. It is served at your own npub, which is how the page knows whose sale to read.

Gateway

nsite.lol

Any NIP-5A host will serve it — the gateway is only where you point people. Changing it changes the URL printed on the flyer's tear-off tabs, so set it before you deploy.

Edit, restock, mark sold, and private notes encrypted to the seller's own key. The honest gap is on this panel: "view settled sales" has no CLINK path at all — Manage's only resource is the offer, and the node's own invoice RPC is keyed on a raw secret NIP-46 does not expose. So the seller's browser cannot see the seller's sales. That is not a bug we failed to fix; it is what holding no key actually costs. Units sold are derived from the relays instead, and the money is read on the machine where the key is.
