

A static page that takes Lightning payments.

No backend of ours. The page asks the seller's own node for an invoice by sending a signed event over public relays.

Nothing in the middle is ours.

The seller's money never leaves the seller's node. We never run one.

CLINK is five specs.

21001	Offers	noffer	Ask a node for an invoice. This is the payment.
21002	Debits	ndebit	Spend <i>from</i> a node, under a cap the node sets. Our refunds.
21003	Manage	nmanage	Create and edit offers — from a browser holding no key.
21004	Enroll	–	Provision an account on a node. Spec'd, not yet built.
30078	Beacon	–	How a node announces itself and its fees.

Three of them carry this demo. Every one is a signed event over a public relay.

The node is *Lightning.Pub*.

- | | | |
|---|--------------|---|
| ✓ | 21001 | Offers — every payment in this demo |
| ✓ | 21002 | Debits — the refund, capped by the node itself |
| ✓ | 21003 | Manage — how every offer here was minted |
| × | 21004 | Enroll — not implemented in v0.0.37 |
| × | 21000 | Not CLINK at all — Lightning.Pub's own RPC, keyed on a secret a remote signer never exposes. A browser cannot speak it. |
-

That last line is why Manage exists in the flow — not as a nicety, but because nothing else could reach the node.
